ABSTRACT:

- The AI Healthcare Assistant is an intelligent system designed to predict diseases based on user-provided symptoms using Machine Learning techniques.
- The system employs a Random Forest Classifier to analyze symptom patterns and generate predictions along with confidence scores.
- A modern web interface built using Streamlit ensures ease of interaction.
- This project demonstrates the practical application of AI in healthcare, enabling early-stage diagnosis and improving accessibility to medical insights.

INTRODUCTION

Artificial Intelligence is transforming the healthcare industry by enabling faster and more accurate decision-making. Many individuals rely on online symptom searches, which can often be misleading. This project aims to provide a structured and reliable system that predicts diseases based on symptoms using machine learning.

The system acts as a **preliminary diagnostic tool**, assisting users in understanding potential health conditions before consulting a doctor.

PROBLEM STATEMENT:

- Lack of quick access to healthcare professionals
- Misleading information from random internet searches
- No structured symptom-based prediction system
- Need for an easy-to-use healthcare assistant

OBJECTIVES:

- Develop a disease prediction model using ML
- Build a user-friendly web interface
- Provide top disease predictions with confidence
- Suggest basic treatments
- Improve accessibility to healthcare insights

METHODOLOGY:

I) WORKFLOW OF THE SYSTEM:

Steps:

1. User inputs symptoms
2. Symptoms converted into binary feature vector
3. ML model processes input
4. Prediction probabilities generated
5. Results displayed in UI

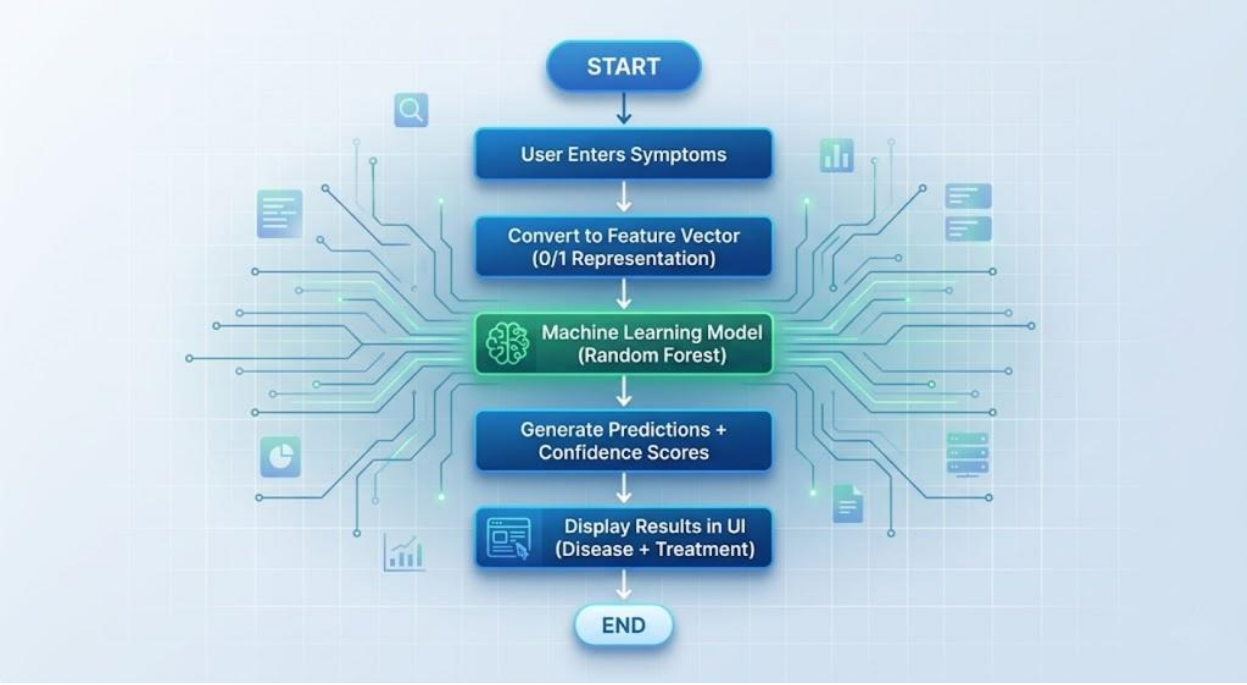
II) DATA COLLECTION

- Dataset created with symptoms and diseases
- Binary encoding used (1 = present, 0 = absent)

III) MODEL SELECTION & MODEL TRAINING

- Handles multiple features efficiently
- Reduces overfitting
- Provides probability-based output
- Dataset split into features and target
- Model trained using Scikit-learn
- Saved using Pickle

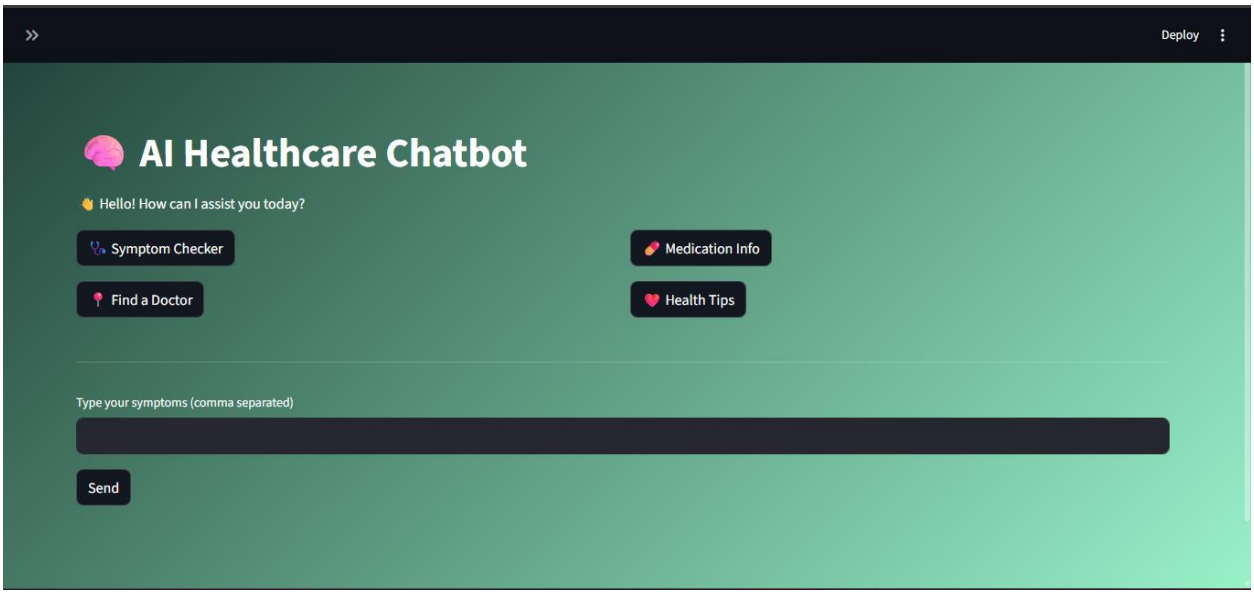
SYSTEM ARCHITECTURE

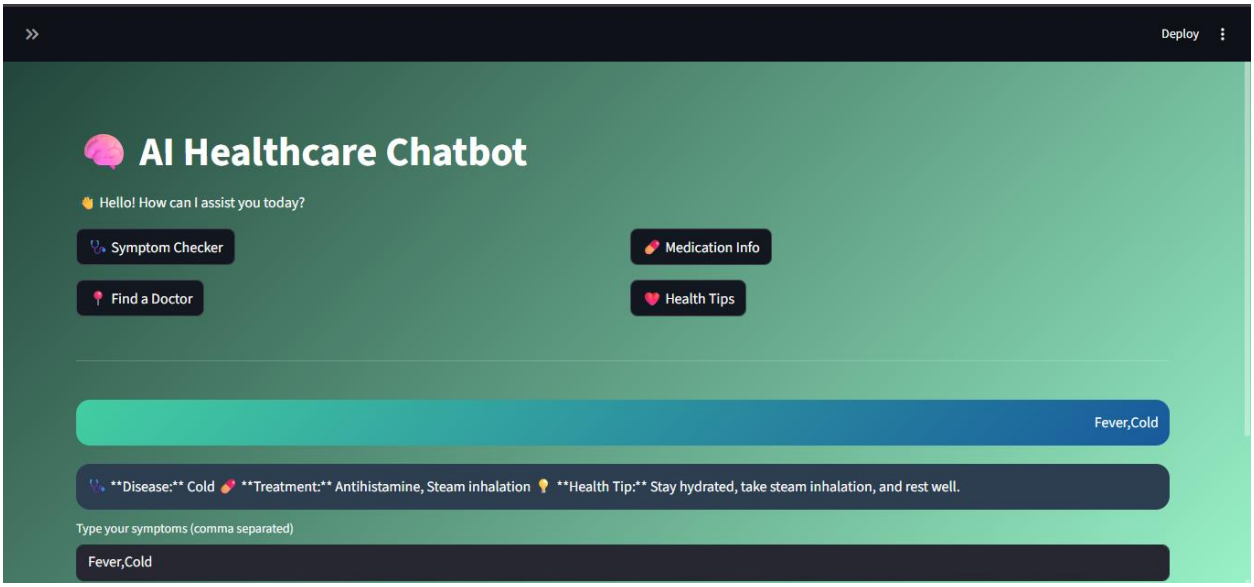


TOOLS AND TECHNOLOGIES:

- **Language:** Python
- **Libraries:** Pandas, NumPy, Scikit-learn
- **Framework:** Streamlit
- **Algorithm:** Random Forest

USER INTERFACE:





RESULTS AND ANALYSIS:

EXAMPLE:

Input:

headache, nausea

Output:

Migraine → 61%
Cold → 15%

ADVANTAGES AND DISADVANTAGES:

Advantages	Limitations
Fast and efficient	Limited dataset
Easy to use	Not a replacement for doctors
Supports early diagnosis	Accuracy depends on input
Accessible anywhere	Cannot handle complex medical conditions

FUTURE SCOPE:

- Integration with real hospital data
- Voice-based assistant
- Mobile app development
- AI chatbot with NLP
- Integration with wearable devices
- Direct access with doctor's instantly
- Medication info and order medicines instantly
- Regular Health tip's notification

CONCLUSION:

The AI Healthcare Assistant demonstrates how machine learning can enhance healthcare accessibility. The system provides reliable predictions and a user-friendly interface, making it a valuable tool for preliminary diagnosis. With further improvements, it can evolve into a powerful healthcare support system.
